

Playbooks

A playbook shows how to implement user experience (UX) methods in the context of the UX process. Our playbooks are specifically designed to help solve problems faced in medical centers throughout the VHA.

Why Use a Playbook?

- Teams that use playbooks are trained not just on the coding feature, but on process, principles, and methods that make projects successful and result in safe, effective, and efficient features.
- When you have time constraints, ambiguous requirements, or other competing priorities, the playbook can help you make decisions about how to get the biggest impact from the UX method(s) you use.
